A $20B company got shut down by a password.

Your supply chain's biggest vulnerability isn't a port. It's your digital infrastructure.

Stryker. March 2026. A single cyber breach shut down a global medical supply chain.

WHAT HAPPENED

How One Breach Took Down Global Healthcare Supply

01 Credentials Exploited

Iran-linked attackers targeted a digital vulnerability in Stryker's systems.

↓

02 Systems Compromised

Order processing, manufacturing, and shipping systems — all went dark.

↓

03 Hospitals Left Scrambling

NHS and global health systems lost access to critical surgical instruments and implants.

↓

04 No Fallback Existed

Specialized medical devices have no alternate sources at scale. Supply simply stopped.

THE REAL RISK

This Isn't IT's Problem. It's Yours.

YOUR ERP

The central nervous system of your supply chain — supplier data, pricing, demand forecasts, production schedules, payments. All in one system. One breach takes it all down.

YOUR VENDORS

Tier 2 suppliers connected to your systems with credentials that haven't been rotated since 2019. If they get breached, you get breached.

YOUR INTEGRATIONS

Built by people who left the company. Documented in files nobody can find. Secured by protocols nobody has audited. Every connection is an unlocked door.

BY THE NUMBERS

Why This Can't Wait

80%
of breaches start with compromised credentials

197
days average time to detect a breach

$4.5M
average cost of a supply chain breach

1
password is all it takes to shut everything down

YOUR MOVE

5 Questions to Ask This Week

1. When was the last cyber risk assessment of your supply chain systems specifically?
2. Have you audited your critical vendors' security posture? Do contracts require it?
3. Do you have an incident response plan for when procurement systems go dark?
4. Is your digital infrastructure diversified or one breach from total shutdown?
5. Is cyber risk a standing item in procurement leadership meetings?

Your supply chain's biggest vulnerability

isn't a port.

It's a password.
